Conclusion

2. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Montpetit (U.S. 6,366,761) teaches a data communication system and method that allocates bandwidth to a ground terminal for uplink transmission by identifying priority status of data packets. Montpetit fails to teach a broadcast signal including a non-real time frame marker, a timing message, and a return channel control message. Montpetit also fails to teach a receiver at the remote user that receives the stated broadcast signal and determines a return channel frame start time using the non-real time frame marker and the timing message. Montpetit also fails to teach a transmitter at the remote user that uplinks a user message on a return channel during a predetermined period after the return channel frame start time, where the uplink frequency of the return channel is determined by the return channel control message present in the broadcast signal.

Dutta (U.S. 5,898,681) teaches a method of balancing loads on TDM channels and on respective channel groups whereby channel group load balancing information is transmitted over TDM channels in order to determine low-load channel groups. Based on an evaluation of the load balancing information by mobile terminals of the channel groups, mobile terminals are

logged into channel groups accordingly. Dutta fails to teach the same limitations described in the paragraph above regarding the Montpetit reference.
